The quantum theory of fluids

Ben Gripaios

Cambridge

February 2015

BMG & Dave Sutherland, 1406.4422, to appear in PRL

Not a typo: fluids not fields

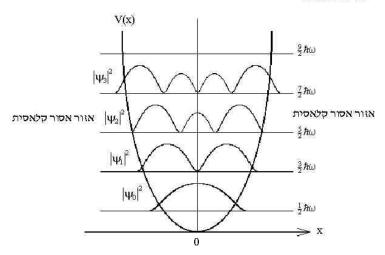

Does \exists a consistent quantum theory of a (perfect, compressible) fluid?

Classical fluids ⊂ classical fields, so:

- quantization an obvious thing to do,
- ▶ but isn't it trivial?

SHO:
$$L = \dot{q}^2 + q^2 \implies E = n + \frac{1}{2}, n \in \mathbb{Z}^+$$

אנרגיה כוללת:

Fluids are special: ∃ vortices

<□ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

$$\textit{L} = \dot{\textit{q}}^2 + {\color{red}0} \textit{q}^2 \implies \textit{E} = \textit{p}^2, \textit{p} \in \mathbb{R}$$

$$L = \dot{q}^2 \implies E = p^2, p \in \mathbb{R}$$
:

- ▶ no Fock space
- ▶ no S-matrix
- ground state delocalized
- perturbation theory inconceivable

Historical approaches . . .

Landau 1941: Assume vortices 'gapped' ⇒ superfluid

Rattazzi et al. 2011: vortex sound speed $\varepsilon \to 0$

Endlich, Nicolis, Rattazzi, & Wang, 1011.6396

$$L = \dot{q}^2 + \varepsilon q^2 \implies E = \varepsilon (n + \frac{1}{2}), n \in \mathbb{Z}^+$$

Endlich, Nicolis, Rattazzi, & Wang, 1011.6396

Everything else blows up.

► Conjecture: quantum fluid inconsistent

► Evidence: data

Endlich, Nicolis, Rattazzi, & Wang, 1011.6396

We claim:

- Conjecture: quantum fluid consistent
- Evidence: computation!
- Also conjecture: quantum fluids unlike classical ones

Why you may care ...

- 1. A new variety of QFT
- 2. We quantize t-dependent diffs $M^d \to M^d$, with $ISO(d,1) \times SDiff(M^d)$ invariant action

But . . .

1. We do not seek a ToE, but rather an EFT

- 1. We do not seek a ToE, but rather an EFT
 - Non-renormalizable
 - Regime in which divergences under control
 - Perturbation theory 'converges'

Outline

- Fluid parameterization
- ► The classical theory of fluids
- The quantum theory of fluids

Fluid parameterization

- 'Bathtub' M^d (e.g. \mathbb{R}^d)
- ▶ Choose coordinates ϕ at t = 0 for fluid particles
- ▶ $x_t(\phi)$ is map $M^d \to M^d$ (Lagrange)

- Claim: cavitation and interpenetration cost finite E
- ▶ At low enough E, $x_t(\phi)$ is bijective
- ▶ Ditto $\phi_t(x)$ (Euler)
- Claim: at large distance φ and x may be assumed diffs

- ► How to parameterize the group Diff(M)?
- ► Naïve exp map: $\exp \pi = x + \pi + \pi(\partial \pi) + \frac{1}{2!}\pi(\partial \pi(\partial \pi)) + \dots$
- ▶ But Diff(M) is not Lie
- ► exp may not exist (counterexample: R)
- exp may not be locally onto (counterexample: S¹)
- ▶ I work in a physics lab, so am allowed to just write $\phi = x + \pi$

$M^d = \mathbb{R}^d$ henceforth

The classical theory of fluids

No one ever writes down the action!

In fact very elegant:

- Fields $\phi(x,t)$
- S invariant under Poincaré transformations on x
- \triangleright and sdiffs of ϕ
- $\blacktriangleright \implies \mathscr{L} = -w_0 f(\sqrt{B}), \text{ where } B = \det \partial_\mu \phi^i \partial^\mu \phi^j.$

Endlich, Nicolis, Rattazzi, & Wang, 1011.6396

Herglotz, 1911

Soper, Classical Field Theory, 2008

Then find

- $T_{\mu\nu} = (\rho + p)u_{\mu}u_{\nu} + p\eta_{\mu\nu}$ is conserved
- $\rho = w_0 f$
- $p = w_0(\sqrt{B}f' f)$
- $\qquad \qquad \mathbf{u}^{\mu} = \frac{1}{2\sqrt{B}} \varepsilon^{\mu\alpha\beta} \varepsilon_{ij} \partial_{\alpha} \phi^{i} \partial_{\beta} \phi^{j}.$

Endlich, Nicolis, Rattazzi, & Wang, 1011.6396

Herglotz, 1911

Soper, Classical Field Theory, 2008

d=2 henceforth

Remark: $T_{\mu\nu}, \rho, p$, and u^μ are all invariant under sdiffs

The quantum theory of fluids . . .

Consider small fluctuations about the classical vacuum:

$$\phi = x + \pi \dots$$

$$\begin{split} \mathcal{L} &= \frac{1}{2}(\dot{\pi}^2 - c^2[\partial\pi]^2) - \frac{(3c^2 + f_3)}{6}[\partial\pi]^3 + \frac{c^2}{2}[\partial\pi][\partial\pi^2] + \frac{(c^2 + 1)}{2}[\partial\pi]\dot{\pi}^2 - \dot{\pi} \cdot \partial\pi \cdot \dot{\pi} - \frac{(f_4 + 3c^2 + 6f_3)}{24}[\partial\pi]^4 \\ &+ \frac{(c^2 + f_3)}{4}[\partial\pi]^2[\partial\pi^2] - \frac{c^2}{8}[\partial\pi^2]^2 + \frac{(1 - c^2)}{8}\dot{\pi}^4 - c^2[\partial\pi]\dot{\pi} \cdot \partial\pi \cdot \dot{\pi} - \frac{(1 - 3c^2 - f_3)}{4}[\partial\pi]^2\dot{\pi}^2 + \frac{(1 - c^2)}{4}[\partial\pi^2]\dot{\pi}^2 + \frac{1}{2}\dot{\pi} \cdot \partial\pi \cdot \partial\pi^T \cdot \dot{\pi} + \dots, \end{split}$$

$$\begin{split} \mathcal{L} &= \frac{1}{2} (\dot{\pi}^2 - c^2 [\partial \pi]^2) - \frac{(3c^2 + f_3)}{6} [\partial \pi]^3 + \frac{c^2}{2} [\partial \pi] [\partial \pi^2] + \frac{(c^2 + 1)}{2} [\partial \pi] \dot{\pi}^2 - \dot{\pi} \cdot \partial \pi \cdot \dot{\pi} - \frac{(f_4 + 3c^2 + 6f_3)}{24} [\partial \pi]^4 \\ &+ \frac{(c^2 + f_3)}{4} [\partial \pi]^2 [\partial \pi^2] - \frac{c^2}{8} [\partial \pi^2]^2 + \frac{(1 - c^2)}{8} \dot{\pi}^4 - c^2 [\partial \pi] \dot{\pi} \cdot \partial \pi \cdot \dot{\pi} - \frac{(1 - 3c^2 - f_3)}{4} [\partial \pi]^2 \dot{\pi}^2 + \frac{(1 - c^2)}{4} [\partial \pi^2] \dot{\pi}^2 + \frac{1}{2} \dot{\pi} \cdot \partial \pi \cdot \partial \pi^T \cdot \dot{\pi} + \dots, \end{split}$$

- a mess
- derivatively coupled: goldstone bosons
- Poincaré non-linearly realized

$$\mathcal{L} = \frac{1}{2}(\dot{\pi}^2 - c^2[\partial \pi]^2)$$

- $c = \sqrt{f_2}$ is speed of sound for $[\partial \pi] \neq 0$
- ▶ $[\partial \pi] = 0 \implies$ gapless vortex modes
- Free particles, not harmonic oscillators!
- ▶ No 'easy' way out: $[\partial \pi] = 0 \implies$ only $\dot{\pi}$ terms

free particles ⇒

- no Fock space
- no S-matrix
- no perturbation theory

Correlators in *d* space dimensions:

- $ightharpoonup \langle \pi_L(x)\pi_L(0)
 angle = \int d\omega d^d k rac{e^{i(\omega t k \cdot x)}}{\omega^2 c^2 k^2} = \mathsf{good}$
- $lack \langle \pi_T(x)\pi_T(0)
 angle = \int d\omega d^d k rac{e^{i(\omega t k \cdot x)}}{\omega^2} = ext{evil}$

Claim: symmetries are those transformations of a system that are unobservable

⇒ only symmetry invariants are (necessarily) observable

cf.

- gauge theories
- ▶ 2*d* sigma models

Jevicki 77

McKane & Stone 80

David 80, 81

Elitzur 83

Let's compute some correlators of invariants, and see what we get . . .

Not ρ, ρ, \ldots , but

$$\sqrt{B}u^0 - 1 = [\partial \pi] + \frac{1}{2}([\partial \pi]^2 - [\partial \pi^2]),$$
$$\sqrt{B}u^i = \dot{\pi}^i + [\partial \pi]\dot{\pi}^i - \dot{\pi}^j\partial_j\pi^i,$$

these are quadratic in π in d=2

2-point functions:

$$\langle [\partial \pi][\partial \pi] \rangle = \frac{ik^2}{\omega^2 - c^2 k^2},$$
$$\langle \dot{\pi}^i [\partial \pi] \rangle = \frac{i\omega k^i}{\omega^2 - c^2 k^2},$$
$$\langle \dot{\pi}^i \dot{\pi}^j \rangle = i\delta^{ij} + \frac{ic^2 k^i k^j}{\omega^2 - c^2 k^2}.$$

Real space correlators all exist!

3-point functions:

Many delicate cancellations Real space correlators all exist

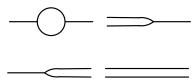

4-point functions also well-behaved

Now consider loops . . .

Now consider loops

- UV and IR divergences
- ▶ IR must cancel in invariants
- ▶ UV can cancel against counterterms

2-point, 1-loop function:

- Vertex factor w₀
- ▶ Propagator factor $\frac{1}{w_0}$
- ▶ 4 diagrams; 100s of contributions

9 (divergent) master integrals:

$$\int \frac{d^d p d^D p}{(4\pi)} \frac{1}{2^{dD}} \frac{1}{P^d + p^2} \frac{1}{(P + K)^2 + (p + k)^2} \frac{1}{p^2} \frac{1}{(p + k)^2} =$$

$$\int \frac{d^d p d^D p}{(4\pi)^{\frac{d+D}{2}}} \frac{1}{(P + K)^2 + (p + k)^2} \frac{1}{p^2} \frac{1}{p^2} =$$

$$\int \frac{d^d p d^D p}{(4\pi)^{\frac{d+D}{2}}} \frac{1}{(P + K)^2} \frac{1}{p^2} \frac{1}{p^2} \frac{1}{p^2} =$$

$$\int \frac{d^d p d^D p}{(4\pi)^{\frac{d+D}{2}}} \frac{1}{P^2 + p^2} \frac{1}{(P + K)^2} \frac{1}{p^2} \frac{1}{(p + k)^2} =$$

$$\int \frac{d^d p d^D p}{(4\pi)^{\frac{d+D}{2}}} \frac{1}{P^2 + p^2} \frac{1}{(P + K)^2} \frac{1}{(P + K)^2} =$$

$$\int \frac{d^d p d^D p}{(4\pi)^{\frac{d+D}{2}}} \frac{1}{P^2 + p^2} \frac{1}{(P + K)^2 + (p + k)^2} \frac{1}{p^2} =$$

$$\int \frac{d^d p d^D p}{(4\pi)^{\frac{d+D}{2}}} \frac{1}{P^2 + p^2} \frac{1}{(P + K)^2 + (p + k)^2} \frac{1}{p^2} =$$

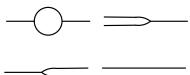

$$\int \frac{d^d p d^D p}{(4\pi)^{\frac{d+D}{2}}} \frac{1}{P^2 + p^2} \frac{1}{(P + K)^2 + (p + k)^2} \frac{1}{p^2} =$$

$$\int \frac{d^d p d^D p}{(4\pi)^{\frac{d+D}{2}}} \frac{1}{P^2 + p^2} \frac{1}{(P + K)^2 + (p + k)^2} \frac{1}{p^2} \frac{1}{p^2} =$$

$$\frac{K^2 - k^2}{4\pi \epsilon k^3 (K^2 + k^2)^2} + \frac{\kappa}{2\pi (K^2 + k^2)^2} + \frac{\kappa}{2\pi (K^2 + k^2)^2} + \frac{2K \tan^{-1}(\frac{K}{k})}{2\pi (K^2 + k^2)^2} - \frac{K^3 + 2K^3 k^2 + 2Kk^4}{\pi (K^3 + k^2)^2} + \frac{\kappa}{2\pi (K^2 + k^2)^2} + \frac{\kappa}{2\pi (K^2 + k^2)^2} + \frac{\kappa}{2\pi (K^2 + k^2)^2} - \frac{1}{\pi (K^2 + k^2)^2} - \frac{K^3 + 2K^3 k^2 + 2Kk^4}{\pi K^3 k^3 (K^2 + k^2)^2} + \frac{\kappa}{2\pi (K^2 + k^2)^2} + \frac{\kappa}{2\pi (K^2 + k^2)^2} + \frac{1}{2\pi (K^2 + k^2)^2} + \frac{\kappa}{2\pi K^3 k^3 (K^2 + k^2)^2} + \frac{\kappa}{2\pi K^3 k^3 (K^2 + k^2)^2} + \frac{\kappa}{2\pi (K^2 + k^2)^2} + \frac{\kappa}{2\pi (K^2 + k^2)^2} + \frac{1}{2\pi (K^2 + k^2)^2} + \frac{1}{2\pi (K^2 + k^2)^2} + \frac{\kappa}{2\pi (K^2 + k^2)^2} + \frac{\kappa}{2\pi$$

TABLE I. Master integrals for the 1-loop, 2-point correlator with external momentum k and euclidean energy K, dimensionally regularized with $d=2+2\epsilon$, $D=1+2\epsilon$, to $O(\epsilon^0)$; $\alpha(k^2)=\frac{1}{2}\log\left(\frac{2\epsilon^{-1}k^2}{\pi}\right)$. The 4th integral appears with a $\frac{1}{\epsilon}$ coefficient in the correlator, and is expanded to $O(\epsilon^1)$.

2-point, 1-loop function:

- ► Tree-level: $\frac{1}{p^2}$
- ► 1-loop: $\int d^{2+1}q \frac{q^6}{(q+p)^8} \sim \sqrt{p^2}$
- All counter-terms are rational functions of p²
- There are no counterterms!
- the correlator must be finite!

Finite 2-point, 1-loop function:

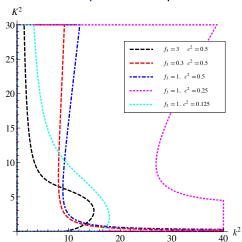

$$\begin{split} \frac{9Kk^6(1+c^4)}{64(K^2+k^2)^2} - \frac{k^4}{1024c^4(K^2+k^2)^{\frac{5}{2}}} \\ \times \left[c^4(1-c^2)^2(19k^4-4K^2k^2+K^4)\right. \\ \left. -2f_3c^2(1+c^2)k^2(5k^2+14K^2) + f_3^2(3k^4+8K^2k^2+8K^4)\right] \end{split}$$

- IR divergences cancel
- UV divergences cancel
- Does perturbation theory converge?

Does perturbation theory converge?

- a.k.a what is the cut-off?
- ▶ not Lorentz-invariant: distance vs. time scales

Ratio of 1-loop to tree amplitudes

Summary

- → ∃ evidence that quantum fluid theory exists as an EFT
- ► This theory is very special: ∃ vortices
- If it exists, it is of interest to explore the consequences
- What are the quantum analogues of turbulence, shocks, surface waves, Kelvin waves, & c. ?
- Nature should make use of it somewhere!
