COUNTRY REPORT: MOROCCO

The Centre for Higher Education and Equity Research (CHEER)

http://www.sussex.ac.uk/education/cheer/
This project is a study of the potential of international mobile women scientists.

The study aims to explore the reasons for the low female participation among grants of the Humboldt-Foundation. The Foundation likes to receive impulses for action on how it can attract more excellent women scientists to the Humboldt Network. To this end, the study combines a needs analysis with a deficit analysis:

The needs analysis will examine the potential for qualified female academics on the demand side and analyse the requirements for the international mobility of female academics and their needs.

The mobility culture and specific aspects of the scientific careers of women scientists will be addressed for some key countries, some of which will be analysed in more detail. For the deficit analysis on the supply side, gender-specific aspects of the Humboldt Programmes will be examined using three selected programmes as examples. By combining the two analyses, the desired impulses for changes that the Foundation could initiate will be identified.

In order to be able to determine the potential of qualified women scientists who could be recruited for a research stay in Germany and their needs, knowledge of gender-specific qualification and career structures, exclusion mechanisms and patterns of international mobility in the individual countries from which the scientists are invited to Germany is necessary in addition to statistical data.

This results in the following focal points for a potential analysis:

1. **Context analysis** of the higher education and research system: key figures on the size and importance of research and development and on participation in tertiary education, basic characteristics, qualification and career structures

2. **Gender participation** in tertiary education and academic careers: including indicators on degrees and doctorates and on academic staff

3. **Gender-specific aspects of scientific careers**: social, cultural and institutional context, horizontal and vertical segregation, whereabouts and drop-outs in science, possible exclusion mechanisms, further gender-specific differentiations, e.g. according to type of university, teaching and research, science sectors, prestige or regional distribution

4. **Gender and international mobility**: Gender-specific data on international mobility, access to (international) networks, significance of international mobility for an academic career, Germany as a target country, needs for funding and changes.

Further intersectional categories such as social background, ethnic origin or racialised characteristics, family situation or region are included, as far as they are relevant for the respective country and data are available.
Prof. Louise Morley

Director

Louise Morley FAcSS is a Professor of Higher Education and Director of the Centre for Higher Education and Equity Research (CHEER) at the University of Sussex, UK. Louise has an international profile in the field of the sociology of gender in higher education. Her current research interests focus on internationalisation and equity, the equity and affective implications of the neoliberal university, and higher education as a public good. She was Principal Investigator for the CHEER Project Higher Education Knowledge Exchange and Policy Learning in the Asian Century and was a Co-Investigator for an ESRC Newton Fund research project on Higher Education and the Public Good: Reflections from Four African Contexts.

Yasser Kosbar

Research Fellow

Yasser Kosbar is a Research Fellow at the Centre for Higher Education and Equity Research – University of Sussex. Yasser’s research interests focus on gender and international mobility. Yasser is currently writing his PhD dissertation on the experience of Egyptian women academics in UK. After earning his Master’s Degree in 2012 from the University of Applied Sciences in Osnabruck (Hochschule Osnabruck), Yasser worked for various organizations including the German Parliament (Bundestag), the OECD, the Economist, and UNCTAD. Yasser is proficient in four languages; Arabic, English, German and French.

Morocco gained its independence from France (and from Spain) in 1956. The State religion is the Malachite branch of Sunni Islam. Classical Arabic and Tamazight (Berber) are the official languages. French is the second language of communication (Boutieri, 2012).

The latest population count neared 37 million in 2020 (UNFPA, 2020). Morocco is considered a young nation with youth constituting the largest portion of its population. Morocco has the highest illiteracy rate in North Africa - 36.5 percent (females 47.6 percent and males 25.3 percent) in 2017.

In terms of gender equality, Morocco ranked 143 globally out of 153 countries in the 2020 Global Gender Gap Index (WEF, 2020).

State feminism, which includes the government’s official policy for the emancipation of women, developed in Morocco post-independence (Ennaji, 2016).

The 2009-2011 Governmental Agenda for Equality proposed equitable access for girls and boys to all domains, including education. The Moroccan Constitution (July 2011) highlights the notion of equality and an end to all forms of discrimination against women (e.g. article 19) (Worlds of Education, 2018).

The National Plan (ICRAM 1&2) is a multi-sectoral governmental plan on gender equality to support the implementation of the commitments expressed in the Government Policy Programme for the period between 2017 - 2021. The Plans provide a platform for mainstreaming women’s rights across the Moroccan public sector.

Women in Morocco have legal autonomy in terms of mobility, marriage, and entering into contractual agreements either for employment or trade. Yet, gender inequality is evident in areas such as economic empowerment and political participation.

Moroccan women’s share in the labour market remains one of the lowest in the region.

The female labour force participation recorded 27 percent compared to the male labour force participation of 78.7 percent. Gendered stratification is evident in terms of employment with 38 percent of women working part time compared to only 8 percent of men. Agriculture remains the sector with the largest share of women employees (WEF, 2020).

Early marriage and household caring responsibilities remain key obstacles facing women’s transition to higher education. According to Article 20 of the family code (Moudawana) the legal age for marriage is 18 years old for both men and women. However, the UNICEF report (2017) shows an increase in the rate of child marriage cases, and the proportion of registered marriages that involve minors has increased by family from 7.0 percent in 2004 to 11.5 per cent in 2013. The United Nations Population Fund suggest that the percentage increased to 14 percent in 2019 (UNFPA, 2020).

Unemployment affects women more than men, with rates reaching 13.5 percent and 7.8 percent respectively.

The number is higher in urban areas than in rural regions, with 21.8 percent of women and 10.3 percent of men residing in cities unemployed (Hatim, 2020a). A gender gap in wages is estimated with Moroccan women earning $3,295 per annum - one third of that earned by men $12,471 (WEF, 2020).

Gender-based violence is a barrier to girls and women access to education, employment and mobility in Morocco. While the law criminalises sexual harassment in employment, intimate-partner violence and other forms of domestic violence are often overlooked by the law (UNWomen, 2017).
As with many emerging economies, the emphasis has traditionally been on counting more girls into primary and secondary education. Morocco ranks 115 globally in terms of equal access to participation (WEF, 2020). This signals a slight improvement from rank 117 in 2018 (WEF, 2018). Bozic (2018) identifies some factors that impede girls’ education:

A. Gender gap in literacy – Between 2008 and 2012, 74 percent of women ages 15-24 were literate, compared to 88 percent of men.

B. Girls’ education is less accessible in rural areas – Only 26 percent of girls in rural locations are enrolled in primary school, compared to 79 percent of boys.

C. The language barrier – While public schools are taught in Arabic, many rural families only speak the Berber language.

D. Cultural barriers still hold girls back – A traditional patriarchal society places value on girls’ roles in the home.

There are many obstacles to female education including poverty, tradition, and patriarchy favouring investment in boys’ education. There are also issues about resource allocation, and neglect of rural and human development (Auletto, 2017; Ennaji, 2018).

State higher education is free for both nationals and foreigners.

All holders of the baccalaureate have the right to a place at university and grants are awarded to students in need. Higher education in Morocco is the responsibility of the State based on the LMD system (Bachelor’s, Master’s, Doctorate) (Buckner, 2011). Prior to the 20th century, the higher education system was mainly religious and based around the Al Quaraouyine University, Fez, one of the world’s oldest universities, founded in the year 859 by a woman - Fatima bint Muhammad Al-Fihriya Al-Qurashiya, and the Ben Youssef University in Marrakech.

Post-colonial investment in higher education grew from 1957, when the state reorganised the two institutes of higher education in science and the arts in the capital Rabat to create the Mohammed V University. This was followed by the development of universities in Fez, Tetouan, Kenitra, Tangiers, and Casablanca. With the merger of universities from September 2015, Morocco now has 12 public universities, 5 institutes of scientific research (Instituts de Recherche Scientifique,) and 31 Cités et Internats Universitaires.

Student numbers in Morocco have almost trebled over the past eight years

The student population increased from 308,000 in 2009-10 to 822,000 in 2017-18 (Grove, 2018). The latest count of students enrolled in higher education reached 913,713 in academic year 2018-19. The public sector enrols over 93 percent of the total number of students (Bougroum & Ibourk, 2011).

The gross enrolment ratio in Tertiary Education (this includes all education for people above school age, including college, university, and vocational courses) in Morocco is still under 40 percent. While there’s gender parity in terms of access, the total enrolment ratio remains relatively low compared to other countries globally.

The rural areas have no institutions of higher education. However, e-learning is being rapidly developed in Morocco (Bouroumi & Fajr, 2014; Riyami et al, 2017). This has been especially important in the context of the 2020 global pandemic (Sawahel, 2020a).

Strategies to reform higher education post-2011 focus on links with the labour market and internationalisation (Cohen, 2014). Quality, governance (Ayad et al, 2020), and student retention (Mansouri & El Amine Moumine, 2017) are challenges. Public universities are facing a large influx of students accompanied by shortages in infrastructure, funding, equipment, and human resources (El Kirat El Allame, 2019).

No Moroccan university appeared in the Shanghai 2020 Academic Ranking of World Universities (ARWU).

The ranking includes the top 1,000 universities in the world. In September 2019, the Times Higher Education included four Moroccan universities in its World University Rankings 2020. However, none of them were in the top 500 on the 1,400-institution list. Sidi Mohamed Ben Abdellah University in Fez ranked first on the national level. Internationally, however, the university ranked in the 601-800 section.

Morocco followed a programme of Arabisation post-independence, and the language issue continues to cause controversy. One of the nation’s senior university leaders - Wail Benjelloun – a former head of Morocco’s Conference of University Presidents and current leader of the Mediterranean Universities Union, which represents 84 universities across 21 Mediterranean countries - argues that Morocco’s seemingly intractable graduate unemployment problem could be eased if fewer university courses were taught in Arabic.

In an interview with Times Higher Education at its Emerging Economies Summit in Rabat, he wanted to see more non-science courses taught in French, Spanish and English, reflecting the country’s proximity to Europe.

Others have questioned whether too many students are taking humanities and social science degrees taught primarily in Arabic, with 75 percent of undergraduates enrolled on such courses. In contrast, only 22 percent of students take science subjects, which are taught in French – a language spoken fluently by only about 15 percent of Morocco’s 37 million citizens (Grove, 2018).

Graduate unemployment is a serious challenge.

In the post-independence era, university graduates were guaranteed prestigious public sector positions (Buckner, 2018), in 2015, 24.4 percent of graduates were unemployed, compared with just 6 percent in 1984, while the current national unemployment rate is about 10 per cent – prompting some to ask whether Morocco’s labour market can support so many graduates (Grove, 2018).

In 1993, a privately-run public university, the Al Akhawyn University, was established based on an American model, with English as the language of instruction. The regulatory framework for private institutions was passed in 2011, and by 2014, five private universities had opened in major cities – Rabat, Casablanca, Marrakech, and Agadir, with two others receiving Ministry approval (Buckner, 2018). In 2015, Morocco’s Ministry of Higher Education, Scientific Research and Professional Training recognised the degrees of eight private universities.

As with many emerging economies, demand for higher education often outstrips supply, and those with material advantages are able to buy access to private providers.

Morocco is a class-bound society, with an elite who are able to afford private education and international universities (Errazzouki, 2014).

A concern for Moroccan higher education is the need to build research capacity. Cohen (2014) suggests that state investment in higher education during a period of nationalism and modernisation provided the material resources and cultural and ideological impetus for critical academic research and analysis. After a peak attained in 2000, the output of Moroccan researchers stagnated or even declined (Medina, 2015). One explanation is the lack of partnerships for knowledge creation.

Rhassate et al (2018) suggest that there is a lack of communication and collaboration between universities in neighbouring countries or sometimes between the universities of the same country. Morocco and Tunisia have recently unveiled a US$2.16 million plan to set up joint laboratories, enhance networking between universities in the two countries, mutually recognise degrees aimed at enhancing student and academic mobility and encourage doctoral theses emanating from joint supervision by the partner institutions (Sawahel, 2020b).

Source: Global Knowledge Index 2019
More girls are now passing the baccalaureate than are boys.

More young women are enrolled in higher education (at the bachelor’s degree level) than young men. However, the number enrolled in masters’ and doctoral courses is far lower. For example, while there are 402 men registered at PhD level in the field of economic law and social sciences, there are only 160 women. No comprehensive study has been conducted to understand the reasons why female graduates are discouraged from pursuing doctoral studies (Boutkhil, 2020).

Women are entering STEM subjects at all levels in Moroccan universities - as students, academics and researchers, but still in fewer numbers than their male counterparts (Bettachy et al, 2009, 2015). However, there have been some notable Moroccan women scientists including Merieme Chadid, the astronomer who was awarded the Arab Woman of the Year title in 2015 (Abdessalam Zerbaoui, 2020).

The Shemera (2014) report stated that the research population is also male-dominated. In 2010 just 32 percent of all researchers in higher education were women and this meant a decrease compared with 2004 when there were 35 percent of female researchers.

Women are also under-represented in academic and leadership.

As Figure 6 demonstrates, women still constitute below 40 percent of researchers. Currently, out of more than 20 universities, only two universities in Morocco are governed by women: the Université Hassan Premier Settat is headed by Khadija Essafi, and the Université Hassan II Casablanca is headed by Aawatéf Hayar (Llorent-Bedmar et al, 2017; Hallward & Stewart, 2018).

A recent study called upon the government to align strategies towards gender equality at all levels of higher education management (Boutkhil, 2020).

This recommends the introduction of a mandatory quota system in university governing bodies, to approach the university’s general budget in a gender-sensitive manner, and to create safe campuses for women along with establishing a national coalition of women in academia in Morocco.

The issue of safe campuses is fundamental in challenging gender-based violence e.g. lighting, security arrangements etc., and is often an essential part of gender mainstreaming activities.

Boutkhil’s study raises questions about whether the increasing number of women in higher education – and those who enter academia – have robust longer-term career opportunities. The study indicated that Moroccan universities lack female representation at all levels. The study added that the low proportion of entry-level assistant professor positions, which is a mere 21.36 percent of faculty members nationwide, highlights the unequal consideration that female applicants receive from hiring committees. The study also reports female faculty members are rarely called on to lead thesis defence juries or to appointment commissions, and are not elected as members of their institutions’ scientific committees (Sawahel, 2020c).

Higher education has a serious gender gap in academic staffing.

In an effort to highlight and challenge the injustices faced by female faculty members in Morocco, a group of academics created the Association of Women University Professors in 2016 at Université Mohammed Premier in Oujda. The Association’s objective is to promote the contribution that female faculty make to academia and to seek greater representation of women in university decision-making positions (Boutkhil, 2020).

Source: Ministry of Higher Education
Since the 1990s, Morocco has introduced a wave of reforms, aimed at aligning Moroccan higher education to the European degree structure (Buckner, 2018), with a view to becoming a partner in the European Higher Education Area (EHEA) (Kohstall, 2015).

**Morocco has opened itself up internationally, particularly to the EU, via a range of strategies:**

1. **The adoption of the LMD system** in 2003 and the process underway to establish the ECTS system- this aligns the higher education curricula with European models and permits the mobility of qualifications and labour cross-nationally;

2. **The establishment of a quality assurance system** to international standards;

3. **The involvement of universities** throughout the world in calls for international projects launched by Morocco;

4. **The active involvement of universities** in the Tempus, Erasmus Mundus and Erasmus+ cooperation programmes;

5. **The merger of universities** with a view to creating poles of excellence in teaching and research and pooling resources in order to develop scientific output and consequently ensure greater visibility internationally;

6. **The consolidation and development** of the international component of the Moroccan higher education system through the creation of international outward-looking universities and institutions such as the Al Akhawayn University in Ifrane, the Rabat International University, the Fèz Euro-Mediterranean University, the Mohammed VI Polytechnic University at Benguérir, the International INSA, the Central School of Casablanca, the IUT International and the Mediterranean Logistics and Transport Institute in Tétouan, the Higher Institute for Lifelong Learning.

7. **The creation of renowned higher education institutions** in the context of international cooperation including:

   • The Central School of Casablanca;
   • International INSA at Fèz;
   • The International IUT at Oujda;
   • The Tangier-Tétouan Mediterranean Institute for Logistics and Transport;
   • The School of Architecture at the International University of Rabat;
   • The Higher Institute for Lifelong Learning.

**Morocco is the first French-speaking African country to welcome African students, and the second overall after South Africa.**

More than 75 percent of students come from sub-Saharan African countries, and there are more than 12,000 sub-Saharan students enrolled at Moroccan universities in the year 2019-2020, from 47 different African countries (Abdellatif, 2020). Foreign students are almost all Moroccan government grant holders. More than 30 percent of students are following a Masters’ or Doctoral course. The pathways of excellence (Medicine, Engineering, Business and Management, Sciences) account for half of this figure. Like their Moroccan counterparts, these students benefit from free education and university welfare services.

Moroccan students participate in a range of short or long-term courses overseas. These are organised by the Ministry in the context of partnerships with other countries or international bodies, or organised in the context of partnerships between Moroccan universities and international universities or bodies. Through the former Tempus and current Erasmus+ programmes, a significant proportion of academic staff have been able to participate in activities alongside their European counterparts. However, there is a growing trend now of travelling to the Americas and Asia.
The total number of outbound international mobile students was 52,500 students in 2019 (UNESCO, 2019).

**France hosts the highest share of Moroccan students abroad with 28,431 students studying there.**

Germany comes at the third place with 3,789 students. Of the challenges facing the internationalisation of higher education in Morocco, the language issue is prominent. Until recently, the debate concerned the language of instruction of sciences. The Arabisation process involved the adoption of Modern Standard Arabic as the language of teaching instead of French. It has been argued that the fact of not generalising Arabisation to higher education has created a divide between pre-secondary education and higher education, and put a heavy burden on the latter.

In France, where Moroccan students account for over 40 percent of international students, there was a 17 percent increase from 2011-2016 to 2016-2017. The numbers of Moroccan students enrolled at UK universities have increased by 13 percent between the 2014/15 and 2017/18 school years (Morocco World News, 2019). A large majority are studying business – the most common field for international students to pursue.

**Questions have been posed about how gender relates to opportunities and experiences of internationalisation (Morley et al. 2019, 2020).**

Mobility is seen as vital in an academic’s career because it provides scholars with opportunities for interaction with other scholars internationally and further professional development. Opportunities for outward mobility can be highly gendered – especially in Africa (Prozesky & Beaudry, 2019). Internationalisation makes visible the patriarchal premium (Bhandari, 2017; Jons, 2011; Matus and Talburt, 2009; Myers and Griffin, 2018; Rosner, 2015). Leemann (2010) suggested that mobility is not viewed as a social experience whose value is neutral, but as something that has value precisely because it can be drawn into fields of asymmetrical gendered relations.

**Opportunities for outward mobility can be highly gendered – especially in Africa.**

She argued that women academics are less geographically mobile than their male counterparts and that greater geographic immobility can put women at a disadvantage with regard to tenure.

**There have been a number of transnational initiatives.**

For example, the UK’s Coventry University has recently opened a branch campus in Morocco. This has been facilitated via the UK-Morocco Higher Education Commission which aims to strengthen strategic partnerships between the Moroccan and British education sectors, particularly in the areas of student mobility and internationalisation, research and innovation, quality assurance and governance, reform in teaching methods and the use of science and technology.

The Moroccan campus will provide programmes in teacher training, business, and science and technology. The institutions will also explore opportunities for joint research and teaching as well as mobility for staff and students between the new site and Coventry’s UK campuses (Bothwell, 2020).

Other UK modern universities also have a presence in Morocco including The Cardiff Metropolitan University (CMU) who offer undergraduate and postgraduate degrees at SIST in Casablanca, Rabat and Tangier. No data are available on gendered participation patterns. The Institute for Higher Studies in Social Communications (IHECS) of Brussels, Belgium, has signed partnerships with a number of Moroccan higher education institutions, including the International University of Rabat (UIR) (Hatim, 2020b).

The partnership will allow the exchange of students, teachers, and educational materials between the UIR and the IHECS. It also provides for the organisation of joint research projects, conferences, and seminars on several subjects and disciplines.
Study Limitations

Gender and Research

Available statistical data on Moroccan higher education in general are patchy and uneven e.g. on attainment or international mobility. Gender is frequently absent from research studies and reports on Moroccan higher education. Some key documents on higher education exclude any consideration of gender (e.g. EC, 2017); and gender is not a variable in studies on student retention (Mansouri & El Amine Moumine, 2017)

Scholarly Attention

As with many middle-income emerging economies, gender has traditionally been the focus for school-based education, rather than higher education. While this is slowly changing, there is a noticeable lack of scholarly attention to the topic in research studies.

Intersectionality

It is rare for studies to intersect gender with other structures of inequality e.g. social class. Hence, research, when it does include consideration of women and higher education, tends to focus on elite communities. Or, rural communities are mentioned as a homogenous and often Orientalised bloc.

Changing Landscape

The higher education landscape is changing rapidly in Morocco e.g. the rise of private higher education. Different reports and studies offer different statistics e.g. higher education enrolment figures. Higher education reform and expansion means that the number of universities especially from the private sector is growing more rapidly than can be recorded.
**Academic Career Development**

Women are not thriving as academics, researchers, or leaders in Moroccan universities.

**Policy Recommendation**

Initiatives could be developed to support women’s academic, research, and leadership careers e.g. see the UK’s *Aurora* and *Athena Swan* Programmes, and strategic links could be made between the Humboldt Foundation and the *Association of Women University Professors* in Morocco.

**Language**

Arabic is the dominant language of education (Zouhir, 2013). French has traditionally been the second language in Morocco. However, the language of global mobility (outside Francophone regions) tends to be English e.g. STEM collaborations, publications, taught programmes of study etc. (El Kirat El Allame, 2019).

**Policy Recommendation**

Women entering Humboldt programmes from Morocco are likely to require language support in English.

**Internationalisation**

Morocco has attracted international students – mainly from sub-Saharan Africa. Moroccan students have traditionally chosen Francophone universities overseas, but many now are selecting Anglophone universities.

**Policy Recommendation**

A publicity campaign will be important to communicate the benefits of studying/working/researching in Germany to Moroccan women e.g. relevant research topics and partnership.

**Quota Systems**

Women from rural and marginalised communities still face challenges in terms of access, retention and outward mobility.

**Policy Recommendation**

Humboldt programmes could introduce quota systems to encourage participation of Moroccan women scientists from socio-economically disadvantaged backgrounds.
Key Findings and Recommendations

Gender and Education

Gender and Education has traditionally been concerned with school-level access and retention. However, more women are now enrolling in universities as students, but are under-represented at postgraduate level, and in academic, research, and leadership roles. While gender equality and mainstreaming are policy discourses, we found little evidence of these processes applied to higher education in terms of employment, career progression, and subject choice.

Policy Recommendation

Partnerships could be formed between Morocco and universities and organisations internationally to undertake gender mainstreaming e.g. The Swedish Secretariat for Gender Research, Gothenburg University, Sweden.

Availability of Data

There are major data gaps in relation to gender and higher education e.g. lack of gender-disaggregated data. There are also few qualitative studies that consider in any detail how gender interacts with higher education opportunities, experiences and outcomes.

Policy Recommendation

Scholarship and data collection on these topics need strengthening and facilitating.

The Centre for Higher Education and Equity Research is located within the Department of Education in Essex House on the University of Sussex campus. The University is situated on a modern campus on the edge of the South Downs National Park near the lively seaside city of Brighton. London is one hour away by train, and there is easy access to Gatwick and Heathrow airports.
